

From the linear economy...

- 1 **REDUCE RESOURCE USE**
- 2 **MINIMISE IMPACT AND POLLUTION**
Eco-design, sustainable procurement, industrial ecology, short supply chains
- 3 **OPTIMISE & INTENSIFY USE**
Sharing economy, zero waste consumption, repairing, retrofitting, product-as-a-service

A reminder of some circular concepts

Reuse: prolonging the useful life of an object by keeping it in use and avoiding it becoming waste e.g. deposit return schemes, pre-loved items, donations, etc.

Sharing economy: an economic system in which goods and services are shared between private individuals. This model favours access to an object rather than ownership.

Industrial ecology: a system in which the waste or by-product of one process is used as an input into another process. This system seeks to optimise the flow of resources, energy and capital usually within a localised area, and minimise new resource extraction.

Frugality & efficiency: "Making do with less" or "doing more with less" - two key principles of the circular economy, which can be applied to all resources used and all processes and stages throughout the life cycle of an object.

Product-as-a-Service: a model in which customers use products through a lease or pay-for use arrangement versus the conventional approach to ownership.

... to the circular economy
